October 17, 2023

## Theorem (AEP)

“Almost all events are almost equally surprising.” Specifically, if  $X_1, X_2, \dots$  are i.i.d.  $\sim p(x)$ , then

$$-\frac{1}{n} \log p(X_1, X_2, \dots, X_n) \rightarrow H(X) \text{ in probability.}$$

## Definition

The *typical set*  $A_\epsilon^{(n)}$  is the set of sequences  $x_1, x_2, \dots, x_n$  satisfying

$$2^{-n(H(X)+\epsilon)} \leq p(x_1, x_2, \dots, x_n) \leq 2^{-n(H(X)-\epsilon)}.$$

## Properties of the typical set

1. If  $(x_1, x_2, \dots, x_n) \in A_\epsilon^{(n)}$ , then
$$H(X) - \epsilon \leq -\frac{1}{n} \log p(x_1, x_2, \dots, x_n) \leq H(X) + \epsilon.$$
2.  $\Pr[A_\epsilon^{(n)}] > 1 - \epsilon$  for  $n$  sufficiently large.
3.  $|A_\epsilon^{(n)}| \leq 2^{n(H(X)+\epsilon)}$ , where  $|A|$  denotes the cardinality of the set  $A$ .
4.  $|A_\epsilon^{(n)}| \geq (1 - \epsilon)2^{n(H(X)-\epsilon)}$  for  $n$  sufficiently large.

## Theorem

Let  $X^n$  be i.i.d.  $\sim p(x)$ . There exists a code that one-to-one maps sequences  $x^n$  of length  $n$  into binary strings with

$$E\left[\frac{1}{n} \ell(X^n)\right] \leq H(X) + \epsilon$$

for  $n$  sufficiently large.

# Source Coding

Which horse won in the horse racing?

ABC TELEGRAPH EXHIBIT FOR THE NATIONAL ARCHIVES  
INVENTIONS EXHIBITION TIM BUNKIN 7/10/8

Which horse won in the horse racing?

| X | Pr   | Code I | Code II |
|---|------|--------|---------|
| 0 | 1/2  | 000    | 0       |
| 1 | 1/4  | 001    | 10      |
| 2 | 1/8  | 010    | 110     |
| 3 | 1/16 | 011    | 1110    |
| 4 | 1/64 | 100    | 111100  |
| 5 | 1/64 | 101    | 111101  |
| 6 | 1/64 | 110    | 111110  |
| 7 | 1/64 | 111    | 111111  |

$$H(X) = - \sum p_i \log p_i = 2\text{bits}$$

Which code is better?

# Source Coding (Data Compression)

- We interpret that  $H(X)$  is the best achievable data compression.
- We want to develop practical **lossless coding algorithms** that approach, or achieve the entropy limit  $H(X)$ .

# Terminology

| $X$ | $Pr$ | Code I | Code II |
|-----|------|--------|---------|
| 0   | 1/2  | 000    | 0       |
| 1   | 1/4  | 001    | 10      |
| 2   | 1/8  | 010    | 110     |
| 3   | 1/16 | 011    | 1110    |
| 4   | 1/64 | 100    | 111100  |
| 5   | 1/64 | 101    | 111101  |
| 6   | 1/64 | 110    | 111110  |
| 7   | 1/64 | 111    | 111111  |

- Source alphabet  $\mathcal{X} = \{0, 1, 2, 3, 4, 5, 6, 7\}$ .
- Code alphabet  $\mathcal{D} = \{0, 1\}$ .
- Codeword, e.g., 010 for  $X = 2$  in Code 1.
- Codeword length, e.g., codeword length for Code 1 is 3.
- Codebook: all the codewords.

## Notation (Alphabet Extension)

The set of all possible sequences based on a finite alphabet  $\mathcal{D}$  is denoted by  $\mathcal{D}^*$ . E.g.,

$$\mathcal{D} = \{0, 1\} \mapsto \mathcal{D}^* = \{0, 1, 00, 01, 10, 11, 000, \dots\}.$$

## Definition (Source Code)

Let  $\mathcal{X}$  be the alphabet of a random variable  $X$ , and  $\mathcal{D}$  be the alphabet of code. A *source code*  $C$  for the random variable  $X$  is a map

$$\begin{aligned} C : \quad \mathcal{X} &\rightarrow \mathcal{D}^* \\ x &\mapsto C(x) \end{aligned}$$

where  $C(x)$  is the codeword associated with  $x$ . Let  $\ell(x)$  denote the length of  $C(x)$ .

## Definition

The *expected length*  $L(X)$  of a source code  $C$  for a random variable  $X$  with probability mass function  $p(x)$  is

$$L(X) = E\ell(X) = \sum_{x \in \mathcal{X}} p(x)\ell(x).$$

| $X$ | $\text{Pr}$ | Code I | Code II |
|-----|-------------|--------|---------|
| 0   | $1/2$       | 000    | 0       |
| 1   | $1/4$       | 001    | 10      |
| 2   | $1/8$       | 010    | 110     |
| 3   | $1/16$      | 011    | 1110    |
| 4   | $1/64$      | 100    | 111100  |
| 5   | $1/64$      | 101    | 111101  |
| 6   | $1/64$      | 110    | 111110  |
| 7   | $1/64$      | 111    | 111111  |

$$L_1(X) = 3$$

$$L_2(X) = 2$$

# Source Coding Applications

- Magnetic recording: cassette, hard drive ...
- Speech compression
- Compact disk (CD)
- Image compression: JPEG

# Source Coding: Set of codes

For  $\mathcal{X} = \{1, 2, 3, 4\}$  and  $\mathcal{D} = \{0, 1\}$ , consider

| $x$        | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|------------|--------|-------|----------|-----------|----------|
| 1          | 1/2    | 0     | 0        | 10        | 0        |
| 2          | 1/4    | 0     | 1        | 00        | 10       |
| 3          | 1/8    | 1     | 00       | 11        | 110      |
| 4          | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$     | 1.75   | —     | —        | —         | —        |
| $E\ell(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

- Code efficiency =  $H(X)/E[\ell(X)]$
- Which code is **best**? Would we prefer  $C_I$  or  $C_{II}$ ?

Consider  $C_I$  and decode string: 00001. It would come from 1, 2, 1, 2, 3 or 2, 1, 2, 1, 3 or 1, 1, 1, 1, 3, or etc.

# Source Coding: Set of codes

For  $\mathcal{X} = \{1, 2, 3, 4\}$  and  $\mathcal{D} = \{0, 1\}$ , consider

| $x$        | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|------------|--------|-------|----------|-----------|----------|
| 1          | 1/2    | 0     | 0        | 10        | 0        |
| 2          | 1/4    | 0     | 1        | 00        | 10       |
| 3          | 1/8    | 1     | 00       | 11        | 110      |
| 4          | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$     | 1.75   | —     | —        | —         | —        |
| $E\ell(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

- Code efficiency =  $H(X)/E[\ell(X)]$
- Which code is **best**? Would we prefer  $C_I$  or  $C_{II}$ ?

Consider  $C_{II}$  and decode string: 0011. It could be either 1, 1, 2, 2 or 3, 4.

# Source Coding: Set of codes

For  $\mathcal{X} = \{1, 2, 3, 4\}$  and  $\mathcal{D} = \{0, 1\}$ , consider

| $x$        | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|------------|--------|-------|----------|-----------|----------|
| 1          | 1/2    | 0     | 0        | 10        | 0        |
| 2          | 1/4    | 0     | 1        | 00        | 10       |
| 3          | 1/8    | 1     | 00       | 11        | 110      |
| 4          | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$     | 1.75   | —     | —        | —         | —        |
| $E\ell(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

- Consider  $C_{III}$ . Can we decode 1100000000?

Yes. But if we only see a prefix, such as 11, we don't know **until we see more bits to the end.**

1100000000 = 3, 2, 2, 2, 2

11000000000 = 4, 2, 2, 2, 2

# Source Coding: Set of codes

For  $\mathcal{X} = \{1, 2, 3, 4\}$  and  $\mathcal{D} = \{0, 1\}$ , consider

| $x$        | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|------------|--------|-------|----------|-----------|----------|
| 1          | 1/2    | 0     | 0        | 10        | 0        |
| 2          | 1/4    | 0     | 1        | 00        | 10       |
| 3          | 1/8    | 1     | 00       | 11        | 110      |
| 4          | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$     | 1.75   | —     | —        | —         | —        |
| $E\ell(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

- Consider  $C_{IV}$ . This code seems at least feasible (since  $E[\ell] \geq H$ ). Decoding seems **easy**: (e.g.,  $111110100 = 111, 110, 10, 0 = 4, 3, 2, 1$ ).

# Source Coding: Code types

## Definition (Nonsingular Code)

A code  $C$  is called *nonsingular* if every realization of  $\mathcal{X}$  maps onto a difference codeword in  $\mathcal{D}^*$ , i.e.,

$$x \neq x' \Rightarrow C(x) \neq C(x').$$

# Source Coding: Code types

## Definition (Nonsingular Code)

A code  $C$  is called *nonsingular* if every element of  $\mathcal{X}$  maps onto a difference string in  $\mathcal{D}^*$ , i.e.,

$$x \neq x' \Rightarrow C(x) \neq C(x').$$

| $x$     | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|---------|--------|-------|----------|-----------|----------|
| 1       | 1/2    | 0     | 0        | 10        | 0        |
| 2       | 1/4    | 0     | 1        | 00        | 10       |
| 3       | 1/8    | 1     | 00       | 11        | 110      |
| 4       | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$  | 1.75   | —     | —        | —         | —        |
| $El(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

$C_I$  is singular.

# Source Coding: Code types

## Definition (Code Extension)

The *extension* of a code  $C: \mathcal{X} \rightarrow \mathcal{D}^*$  is defined by

$$C(x_1x_2 \cdots x_n) = C(x_1)C(x_2) \cdots C(x_n).$$

## Definition (Unique Decodable Code)

A code is called *uniquely decodable* if its extension is nonsingular.

$$x_1x_2 \cdots x_m \neq x'_1x'_2 \cdots x'_n \Rightarrow C(x_1x_2 \cdots x_m) \neq C(x'_1x'_2 \cdots x'_n)$$

# Source Coding: Code types

## Definition (Unique Decodable Code)

A code is called *uniquely decodable* if its extension is nonsingular.

$C_{II}^*$  is **singular**. ( $C(1, 1) = C(3) = 00$ )

| $x$     | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|---------|--------|-------|----------|-----------|----------|
| 1       | 1/2    | 0     | 0        | 10        | 0        |
| 2       | 1/4    | 0     | 1        | 00        | 10       |
| 3       | 1/8    | 1     | 00       | 11        | 110      |
| 4       | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$  | 1.75   | —     | —        | —         | —        |
| $El(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

$C_I$  is singular.

$C_{II}$  is **NOT** u.d..

# Source Coding: Code types

## Definition (Unique Decodable Code)

A code is called *uniquely decodable* if its extension is nonsingular.

$C_{III}$  is **uniquely decodable**.

| $x$     | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|---------|--------|-------|----------|-----------|----------|
| 1       | 1/2    | 0     | 0        | 10        | 0        |
| 2       | 1/4    | 0     | 1        | 00        | 10       |
| 3       | 1/8    | 1     | 00       | 11        | 110      |
| 4       | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$  | 1.75   | —     | —        | —         | —        |
| $El(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

$C_I$  is singular.

$C_{II}$  is **NOT** u.d..

# Source Coding: Code types

## Definition (Unique Decodable Code)

A code is called *uniquely decodable* if its extension is nonsingular.

$$1100000000 = 3, 2, 2, 2, 2$$

$$11000000000 = 4, 2, 2, 2, 2$$

To know the source, we  
have to **wait until the end!**

| $x$     | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|---------|--------|-------|----------|-----------|----------|
| 1       | 1/2    | 0     | 0        | 10        | 0        |
| 2       | 1/4    | 0     | 1        | 00        | 10       |
| 3       | 1/8    | 1     | 00       | 11        | 110      |
| 4       | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$  | 1.75   | —     | —        | —         | —        |
| $El(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

$C_I$  is singular.

$C_{II}$  is **NOT** u.d..

# Source Coding: Code types

## Definition (Prefix Code)

A code  $C$  is called a *prefix code* (a.k.a. *instantaneous*) iff no codeword of  $C$  is a prefix of any other codeword of  $C$ .

| $x$     | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|---------|--------|-------|----------|-----------|----------|
| 1       | 1/2    | 0     | 0        | 10        | 0        |
| 2       | 1/4    | 0     | 1        | 00        | 10       |
| 3       | 1/8    | 1     | 00       | 11        | 110      |
| 4       | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$  | 1.75   | —     | —        | —         | —        |
| $El(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

$C_I$  is singular.

$C_{II}$  is NOT u.d..

$C_{III}$  is NOT prefix.

$C_{IV}$  is prefix.

# Source Coding: Code types

For  $\mathcal{X} = \{1, 2, 3, 4\}$  and binary code, consider

| $x$        | $p(x)$ | $C_I$ | $C_{II}$ | $C_{III}$ | $C_{IV}$ |
|------------|--------|-------|----------|-----------|----------|
| 1          | 1/2    | 0     | 0        | 10        | 0        |
| 2          | 1/4    | 0     | 1        | 00        | 10       |
| 3          | 1/8    | 1     | 00       | 11        | 110      |
| 4          | 1/8    | 10    | 11       | 110       | 111      |
| $H(X)$     | 1.75   | —     | —        | —         | —        |
| $E\ell(X)$ | —      | 1.125 | 1.25     | 2.125     | 1.75     |

- $C_I$  is singular.
- $C_{II}$  is non-singular, but not uniquely decodable.
- $C_{III}$  is non-singular, uniquely decodable, but NOT prefix.
- $C_{IV}$  is non-singular, uniquely decodable, and prefix.

# Source Coding: Classes of codes

- Goal: to find a **prefix code** with **minimum** expected length.

## Theorem 5.2.1 (Kraft Inequality)

*For any prefix code over an alphabet of size  $D$ , the codeword lengths  $\ell_1, \ell_2, \dots, \ell_m$  must satisfy the inequality*

$$\sum_i D^{-\ell_i} \leq 1.$$

*Conversely, given a set of codeword lengths that satisfy this inequality, there exists a prefix code with these codeword lengths.*

# Kraft Inequality

**Proof Idea.** (A small example) To prove: A prefix code with lengths  $\ell_1, \ell_2, \dots, \ell_m$ , the inequality

$$\sum_i D^{-\ell_i} \leq 1 \quad \text{holds.}$$

$$\sum_i 2^{-\ell_i} \leq 1 \Leftrightarrow \sum_i 2^{\ell_{\max}-\ell_i} \leq 2^{\ell_{\max}}$$

# Kraft Inequality

**Proof.** (in general)

- Represent the set of prefix codes on a  $D$ -ary tree:

- Codewords correspond to leaves
- Path from root to each leaf determines a codeword
- **Prefix condition:** won't get to a codeword until we get to a leaf (no descendants of codewords are codewords)

# Kraft Inequality

**Proof.** (in general)

- $\ell_{\max} = \max_i(\ell_i)$  is the length of the longest codeword.
- We can expand the full-tree down to depth  $\ell_{\max}$ :

The nodes at the level  $\ell_{\max}$  are either

- 1 codewords
  - 2 descendants of codewords
  - 3 neither
- Consider a codeword  $i$  at depth  $\ell_i$  in tree
  - There are  $D^{\ell_{\max} - \ell_i}$  descendants in the tree at depth  $\ell_{\max}$
  - Descendants of code  $i$  are **disjoint** from decedents of code  $j$  (prefix free condition)

# Kraft Inequality

**Proof.** (in general)

- All the above implies:

$$\sum_i D^{\ell_{\max} - \ell_i} \leq D^{\ell_{\max}} \Rightarrow \sum_i D^{-\ell_i} \leq 1$$

- **Conversely:** given codewords lengths  $\ell_1, \ell_2, \dots, \ell_m$  satisfying Kraft inequality, try to construct a **prefix code**.

# Kraft Inequality

**Proof.** (in general)

- **Conversely:** given codewords lengths  $\ell_1, \ell_2, \dots, \ell_m$  satisfying Kraft inequality, try to construct a prefix code.

$$\{\ell_1, \ell_2, \ell_3\} = \{1, 2, 3\}$$

$$2^{-1} + 2^{-2} + 2^{-3} < 1$$

| $x$ | $c(x)$ |
|-----|--------|
| 1   | 0      |
| 2   | 11     |
| 3   | 101    |

$C$  is prefix.

# Kraft Inequality

**Proof.** (in general)

- **Conversely:** given codewords lengths  $\ell_1, \ell_2, \dots, \ell_m$  satisfying Kraft inequality, try to construct a **prefix code**.

Left as an **Exercise**.
